What political responsibility does the city attribute to Westmount municipality regarding the flooding issues associated with the intercepting sewer on St. Catherine street?

↓ Gold Retrieved article

The Coteau Harron main sewer was built in 1867 in a low swampy valley, when the street was not formed and consequently no houses could have existed then. The natural conclusion is that the houses must have been built since the sewer was constructed, and therefore, the city should not be held responsible. In regard to the intercepting sewer on St. Catherine street, there is only one portion of it which is at present needed during heavy rainstorms, that is between St. Lawrence and St George streets. These floodings take place only when there is an exceptionally heavy rainstorm, but these floodings would not have occurred if Westmount municipality, who had the permission of the city to drain their drainage into the intercepting sewer, had abided by the plan which they submitted to the city.
